TECHNICAL MEMORANDUM
WRE # 356

SURFACE WATER QUALITY MONITORING NETWORK
SOUTH FLORIDA WATER MANAGEMENT DISTRICT

January, 1998

INTRODUCTION

The South Florida Water Management District (District) has the responsibility to manage water and related resources for the benefit of the public and in keeping with the needs of the region. The key elements of its mission are:

1. Protection and Enhancement of the Environment,
2. Water Supply,
3. Flood Protection and
4. Water Quality Protection.

The District uses various approaches to protect water quality. These approaches range from monitoring, testing and researching those water quality parameters related to the District's operations, land management activities, and regulatory functions. To meet the demands of these functions, the District collects and maintains an extensive database of surface water quality and hydrologic information in the Department of Water Resources Evaluation (WRE).

Three goals for Environmental Service programs administered by WRE are:

1. To provide water quality data and evaluations from a network of sampling stations to support water resource management decision-making;
2. To optimize the efficiency of data collection monitoring networks, and ensure data accuracy through rigorous quality control; and,
3. To develop and maintain a water quality database to provide efficient data access.

To address these goals, (40) major water quality monitoring programs are currently managed by the Water Quality Monitoring Division (WQMD), as well as other agencies, and some through contractual agreements. These programs encompass a wide variety of south Florida ecosystems, land uses and hydrologic systems. Monitoring points include lakes, rivers, canals, wetlands, dairies, the intracoastal waterway, estuaries, rainfall, and water control structures. Due to the dynamics of surface water flow in south Florida, the data from one monitoring program often augments data from another. Often data collected from routine monitoring programs are used to supplement more specific water quality studies.

PURPOSE AND SCOPE

This report presents the objectives and purpose of each monitoring program, the location of the monitoring sites, the types of parameters tested, the period of record, the frequencies of sampling, and basic statistics for some parameters. Other sources of information on these monitoring programs are listed at the end of each chapter under 'District Publications'.

There are 40 major water quality monitoring programs that incorporate 991 sampling locations. Depending on the specific program and/or parameter, the sampling frequencies range from weekly to biannually. In addition, some sampling is done only during storm events. The parameters analyzed include basic inorganics (nutrients, cations, anions and metals), organics (e.g. pesticides and the degradation products, base neutral/acid extractable, and purgeable compounds), and physical parameters such as (temperature, dissolved oxygen, pH, specific conductance, etc.).

The District follows strict QA/QC (Quality Assurance / Quality Control) procedures approved by the Florida Department of Environmental Protection (FDEP) for both the field and laboratory

work. Any contractual laboratory has to have an FDEP approved laboratory QA Plan, and be certified by the department of Health and Rehabilitative Services.

The programs presented in this document directly support the following legislative acts, permits, agreements, and any other legal requirements:

1. Surface Water Improvement and Management (SWIM) Act of 1987.

2. Permits issued by the Florida Department of Environmental Protection(FDEP), and the Environmental Protection Agency(EPA).

3. Memorandum of Agreement (MOA) between the Everglades National Park (PARK), the District, and the United States Army Corps of Engineers(COE).

4. MOA's between the District and the Miccosukee and Seminole Indian Tribes of Florida.

5. MOA between the District, the United States Department of Agriculture, and the Environmental Protection Agency.

The areal extent of the surface water quality monitoring programs maintained by the District are shown in Figure 1. The 40 individual monitoring programs are grouped together under 24 main networks; 22 are geographic areas, and the other two; The Pesticide and Atmospheric Deposition monitoring programs are District wide. These networks are:

1. Upper Kissimmee Chain of Lakes and Tributaries
   a. Upper Kissimmee River Chain of Lakes
   b. Tributaries of the Upper Kissimmee

2. Kissimmee River
   a. Kissimmee River
   b. Tributaries of the Kissimmee River

3. Arbuckle Creek

4. Lake Istokpoga

5. Lower Kissimmee River Basin

6. Taylor Creek/Nubbin Slough

7. Indian River Lagoon

8. St. Lucie Estuary

9. Upper and Lower East Coast

10. Works of the District Compliance Monitoring

11. Lake Okeechobee
    a. Inflows and Outflows
    b. Limnetic and Littoral Zones

12. Caloosahatchee River

13. Everglades Nutient Removal

14. Holey Land
    a. Permitted Inflows and Outflows
    b. Interior Marsh Sites

15. Everglades Protection Area

16. Big Cypress Seminole Indian Reservation

17. Water Conservation Areas Inflows and Outflows

18. Biscayne Bay Monitoring

19. Everglades National Park
    a. Inflows and Outflows
    b. Interior Monitoring

20. Routine Pesticide Monitoring Network

21. Precipitation Monitoring Network

22. Manatee Bay/Long Sound

23. South Florida Estuarine Monitoring Network

24. Big Cypress National Perserve

This report is an update to Technical Memorandum of the same title from June 1994 and provides basic information to researchers, consultants, and other persons regarding the availability of routine water quality data in the District's database. Because of the dynamic nature of monitoring programs, updates of this document will be done periodically. The location of the water quality stations are mapped, and the available data are summarized in table format. This allows data users to choose appropriate identification numbers and request any or all of the water quality data available for a given period or area. The time frame used in this publication is, whenever the program and monitoring locations were first sampled until September 30, 1996.

REPORT FORMAT

The report describes the purpose and scope of the surface water quality monitoring programs in geographic sequence from north to south, as shown in Figure 1. This is followed by tables 1,2, and 3 that list the parameters analyzed.

The subsequent sections provide details on each monitoring program. Following the discussion on each sampling program is a figure of sampling stations. Tables list the station identification number, latitude and longitude, a description of the site location (including location from a District structure), the period of record, types of parameters analyzed, and sample collection method. Other tables contain basic statistics on data for each monitoring location.

The data provide important sources of information for preparation of management plans required by SWIM Act's and other mandated or legal requirements. District publications resulting from these intensive monitoring programs are at the end of each section. The reader should refer to these publications for interpretations, analyses, and evaluations of the water quality data.

The appendix contains a list of the abbreviations and their descriptions, and a cross reference guide for sampling station names and project codes.

DATA AVAILABILITY

Data can be obtained either by using a modem or internet to access the Water Quality and Hydrologic databases via REMO, or sending in a written request. For more information about either of these contact Angela Chong at the address below or call at 561-687-6514.

Water Resources Evaluation Department
South Florida Water Management District
P. O. Box 24680
West Palm Beach, FL 33416-4680

Written requests should include the following information:

1. Requestor's name, address, and phone number.
2. Station identification or area of concern.
3. Period of record desired.
4. Parameters or parameter groups desired.
5. A brief explanation of how the data will be used (for documentation purposes).

The District may assess a charge for providing data to the public in keeping with the Public Records Act (Section 119.085FS) and the Electronic Record Keeping Rule (1B-26.033FAC).

ACKNOWLEDGEMENTS

I would like to acknowledge all the people that helped in the process of completing this document.

1. Larry Grosser, Joe Albers, and Cecelia Weaver for their help in reviewing and updating their appropriate sections in this document ;

2. Janet Wise for creating the maps;

3. District field staff who collected the samples for the monitoring programs documented in this report; and,

4. District laboratory staff who analyze the water samples collected from all the different monitoring programs.

Total Zinc	µg/L
Total Arsenic	µg/L
Total Lead	mg/L
Total Iron	µg/L
Methyl Mercury	µg/L
Chromium VI	µg/L
Chromium III	µg/L

OTHER	UNITS
Chlorophyll	
Carotenoid	mg/m^3
Chlorophyll a	mg/m^3
Chlorophyll a2	mg/m^3
Chlorophyll b	mg/m^3
Chlorophyll c	mg/m^3
Pheophytin a	mg/m^3
Total Coliform	cfu/100ml
Fecal Coliform	cfu/100ml
Heterotrophic Plate Count	cfu/100ml
Fecal Streptococci	cfu/100ml
Fecal Coliform Most Probable Number(FCMPN)	mpn/100ml
Total Coliform Most probable Number(TCMPN)	mpn/100ml
Dissolved Inorganic carbon(DIC)	mg/L
Dissolved organic Carbon(DOC)	mg/L
Total Inorganic carbon(TIC)	mg/L
Total Organic carbon(TOC)	mg/L

- = No Units

TABLE 2. PESTICIDES ANALYZED IN SURFACE WATER AND SEDIMENT SAMPLES**

2,4-D	ethion
2,4,5-T	ethoprop
2,4,5-TP (Silvex)	ethylene thiourea*
acephate*	fenamiphos (nemacur)
alachlor	fonophos (dyfonate
aldicarb	gamma BHC (lindane)
aldrin	glyphosate*
alpha BHC	heptachlor
alpha endosulfan	heptachlor epoxide
ametryn	hexazinone*
atrazine	linuron
azinphos methyl (guthion)	malathion
benomyl	metalaxyl*
beta endosulfan	methamidaphos
beta BHC	methomyl
bromacil	methoxychlor
butylate*	metolachlor
carbaryl	metribuzin
carbofuran	mevinphos
carbophenothion (trithion)	mirex
chlordane	monocrotophos (azodrin)
chloropyrifos ethyl	naled
chloropyrifos methyl	norflurazon*
chlorothalonil	oxamyl
delta BHC	paraquat
demeton	parathion ethyl
diazinon	parathion methyl
dicofol (kelthane)	phorate
dieldrin	p,p'-DDD
dimethoate*	p,p'-DDE
diquat	p,p'-DDT
disulfoton	prometryn
diuron	simazine
endosulfan sulfate	toxaphene
endrin	trifluralin
endrin aldehyde	zinc phosphide*

TABLE 3. PRIORITY POLLUTANTS ANALYZED IN WATER AND SEDIMENT*

Base Neutral and Acid Extractable Compounds

acenaphthene	hexachlorobenzene
acenaphthylene	hexachlorobutadiene
anthracene	hexachloroethane
benzo(a)anthracene	indeno(1,2,3-cd)pyrene
benzo(b)fluoranthene	isophorone
benzo(k)fluoranthene	naphthalene
benzo(a)pyrene	nitrobenzene
benzo(g,h,i)perylene	n-nitrosodi-n-propylamine
bis(2-chloroethyl)ether	phenanthrene
bis(2-chloroethoxy)methane	pyrene
bis(2-ethylhexyl)phthalate	1,2,4-trichlorobenzene
bis(2-chloroisopropyl)ether	4-chloro-3-methylphenol
4-bromophenyl-phenyl-ether	2-chlorophenol
2-chloronaphthalene	2,4-dichlorophenol
4-chlorophenyl-phenyl ether	2,4-dimethylphenol
chrysene	2,4-dinitrophenol
dibenz(a,h)anthracene	2-methyl-4,6-dinitrophenol
di-n-butylphthalate	2-nitrophenol
1,3-dichlorobenzene	4-nitrophenol
1,2-dichlorobenzene	pentachlorophenol
1,4-dichlorobenzene	phenol
3,3'-dichlorobenzidine	2,4,6-trichlorophenol
diethyl phthalate	benzidine
dimethyl phthalate	hexachlorocyclopentadiene
2,4-dinitrotoluene	n-nitrosodimethylamine
2,6-dinitrotoluene	n-nitrosodiphenylamine
di-n-octylphthalate	1,2-diphenylhydrazine
fluoranthene	2,3,7,8-TCDD
fluorene	

Organochlorine Pesticides and PCB's

aldrin	PCB-1221
beta BHC	PCB-1232
delta BHC	PCB-1242
chlordane	PCB-1248
p,p'-DDD	PCB-1254
p,p'-DDE	PCB-1260
p,p'-DDT	toxaphene
dieldrin	endrin
endosulfan sulfate	alpha BHC
endrin aldehyde	gamma BHC
heptachlor	endosulfan alpha (I)
heptachlor epoxide	endosulfan beta (II)
PCB-1016

SECTION 1

UPPER KISSIMMEE RIVER CHAIN OF LAKES AND TRIBUTARIES PROJECT CODES: UKCL and TUK

Purpose and Scope

The Upper Kissimmee Chain of Lakes and Tributaries water quality monitoring program includes five major lakes and three tributaries in the Kissimmee Chain: East Lake Tohopekaliga, Lake Tohopekaliga, Lake Cypress, Lake Hatchineha, Lake Kissimmee, Boggy Creek, Reedy Creek, and Shingle Creek. The water quality monitoring program provides a water quality and nutrient loading data base for:

1. Applying eutrophication models to develop and refine nutrient loading targets for the five major lakes in the chain;

2. Determining the long and short term trends necessary to determine the effectiveness of basin management, and identifying potential problem areas in terms of water quality degradation and nutrient loadings;

3. Assessing the in-lake effects of basin management plan implementations and lake draw downs; and

4. Investigating the relationship between the lakes in the chain and the impact on downstream water bodies.

The program began in 1981 with 40 water quality monitoring sits. In June 1985 the program was reduced to 13 key locations for long term monitoring, and in 1991 the number of stations was increased to 16.

Sampling Locations and Descriptions

The locations of the 16 sites monitored under these programs are shown in Figure 2. Table 4 lists all station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 5 contain statistics for each monitoring location.

SECTION 2

KISSIMMEE RIVER
PROJECT CODES: V, KREA, and TFWQ

Purpose and Scope

The Kissimmee River (C-38) water quality monitoring program extends along the river from the source at the southern end of Lake Kissimmee to the outfall at Lake Okeechobee. The water quality monitoring program established in 1972 provides a water quality and nutrient loading data base for:

1. Determining loadings to Lake Okeechobee from the Kissimmee River;

2. Determining the effectiveness of the lower Kissimmee River Best Management Practices in improving water quality along the river;

3. Implementing Lake Okeechobee Technical Advisory Committee's (LOTAC)'s recommendation for a comprehensive monitoring and research plan as described in the Department of Environmental Regulation's "Lake Okeechobee Monitoring and Research Plan";

4. Determining long and short term trends associated with the Kissimmee River restoration project;

5. Determining long and short term trends necessary to identify potential problem areas in terms of water quality degradation;

6. Assessing tributary and basin loading and concentration inputs to Lake Okeechobee which include the following:

   a) Providing levels of Total Phosphorus at the inflows to Lake Okeechobee to compare with the 0.18 mg/l total phosphorus SWIM standard for the basin loading calculations.

   b) Providing data that will delineate the relative importance of tributary loading within the basin, to the basin, and to the whole basin output.

   c) Providing data that will help evaluate the efficacy of the Kissimmee River Restoration Project.

7. Developing basin and spatial scale models used to predict changes in loads to Lake Okeechobee as a function of land use. This includes:

   a) Providing data for determining statistical or mechanistic relationships between rainfall, land use (or land type), and nutrient runoff into streams.

   b) Providing data to help identify the reason for high episodic phosphorus events.

Sampling Locations and Descriptions

The location of the 35 sites monitored under these programs are shown on Figure 3. One sample is collected at each of the six structures on the Kissimmee River, and 29 samples are collected either in the major tributaries or in the river located in pools A through D of the Kissimmee River. Table 6 lists all station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 7 contain statistics for each monitoring location. Project TFWQ is a compliance monitoring program which will end in February 1998.

SECTION 3

ARBUCKLE CREEK
PROJECT CODE: ARCK

Purpose and Scope

The Arbuckle Creek basin water quality monitoring program encompasses an area characterized by beef, intensive dairy cattle, and citrus operations. The basin is located in Highlands and Polk Counties. Water quality monitoring stations have been sampled since 1988.

The objectives of this program are:

1. Monitoring water quality in support of the FDEP's Dairy Rule by providing nutrient concentrations at the dairy outflows and providing information to evaluate the effectiveness of dairy BMP's.

2. Assessing tributary, basin loading, and concentration inputs to Lake Okeechobee. The data will delineate the relative importance of tributary loading within the basin, and to the whole basin output.

3. Developing basin and spatial scale models to predict changes in loads to Lake Okeechobee as a function of land use including the following:

   a) Providing data for determining statistical or mechanistic relationships between rainfall, land use (or land type), and nutrient runoff into streams.

   b) Providing data to help identify the cause of high episodic phosphorus events.

Data generated from this program also support the Lake Istokpoga water quality monitoring program and is integral in development of the Lake Okeechobee Water Quality Management Plan as required by the state's Surface Water Improvement and Management Legislation of 1987.

Sampling Locations and Descriptions

The locations of the 8 sites monitored under this program are shown in Figure 4. Table 8 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 9 contain statistics for each monitoring location.

District Publications

None.

SECTION 4

LAKE ISTOKPOGA MONITORING PROGRAM
PROJECT CODE: ISTO

Purpose and Scope

The Lake Istokpoga water quality monitoring program encompasses the major inflow and outflow points to the lake as well as in-lake monitoring. The water quality monitoring program provides a water quality and nutrient loading data base for:

1. Consolidating information from all previous publications to establish historical trends;

2. Determining long and short term trends to identify potential problem areas of water quality degradation and nutrient loadings;

3. Producing a nutrient budget for the lake;

4. Note changes in water quality after herbicide treatments to the lake (Pre-treatment 1988, Post-treatment 1989 to present); and

5. Establishing acceptable nutrient loading limits using eutrophication models.

Water quality monitoring began in February 1988. Nutrient loadings are calculated by combining nutrient concentrations with flow data obtained at the major inflow and outflow points to the lake. These data can indicate trends in water quality and allow for better management of the system to monitor for environmental enhancement or degradation. Values that deviate significantly from established criteria may signal a concern requiring immediate attention.

Sampling Locations and Descriptions

The locations of the 12 sites monitored under this program are shown on Figure 5. Table 10 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the samples are collected upstream or downstream, and type of sample collection. Table 11 contain statistics for each monitoring location.

SECTION 5

LOWER KISSIMMEE RIVER BASIN
PROJECT CODE: KREA and LKR

Purpose and Scope

The Lower Kissimmee River Basin water quality monitoring program encompasses an area characterized by beef and intensive dairy cattle operations. Water quality monitoring stations have been established at locations throughout the Kissimmee River basin in Okeechobee and Highlands Counties.

The objectives of the program are as follows:

1. Monitoring water quality in support of the FDEP's Dairy Rule by providing nutrient concentration measurements at the dairy outflows, and information to evaluate the effectiveness of dairy BMP's and the Dairy Buy-out program.

2. Assessing tributary, basin loading, and concentration inputs to Lake Okeechobee which include the following:

    a) Providing concentration measurements from inflows to Lake Okeechobee to compare with the 0.18 mg/l total phosphorus SWIM standard, and for use in basin loading calculations.

    b) Providing data that will delineate the relative importance of tributary loading within the basin to the whole basin output.

    c) Providing concentration measurements that will help evaluate the efficacy of the Kissimmee River restoration project.

3. Developing basin and spatial scale models to predict changes in loads to Lake Okeechobee as a function of land use which includes:

    a) Providing data for determining statistical or mechanistic relationships between rainfall, land use (or land type), and nutrient runoff.

    b) Providing data to help identify the reason for high episodic phosphorus events.

Data generated by this program serve two additional purposes:

i) To provide a data base in support of SFWMD funded contractual research with the University of Florida Institute of Food and Agricultural Sciences to evaluate the physical, chemical, and biological conditions and processes that govern phosphorus uptake, release, and movement through the soils in the basin; and

ii) To fulfill the commitment by the District to provide water quality sampling and analysis support for the $1.25 million federal Rural Clean Water Program (RCWP) grant for cost sharing of BMP implementation. The RCWP is administered by the United States Department of Agriculture and the Environmental Protection Agency.

Data gathered under this program are also integral in development of the Lake Okeechobee Water Quality Management Plan as required by the State's Surface Water Improvement and Management (SWIM) legislation of 1987.

Sampling Location and Description

The locations of the 46 sites monitored under this program are shown in Figure 6. Table 12 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 13 contain statistics for each monitoring location.

SECTION 6

TAYLOR CREEK NUBBIN SLOUGH
PROJECT CODE: TCNS

Purpose and Scope

The Taylor Creek/Nubbin Slough water quality monitoring program encompasses an area characterized by beef and intensive dairy cattle operations. The basin is located primarily in southeast and central Okeechobee County and parts of Martin County.

A water quality monitoring network has been sampled by SFWMD since 1979. This program was initiated as a means of identifying trends and quantifying changes in water quality due to changes in land use and/or implementation of BMPs on beef cattle ranches and dairy farms in the basin. This program is jointly funded by the state/federal Taylor Creek Headwaters/Rural Clean Waters Program. The program is part of the District's Lake Okeechobee Operating Permit, granted by the Florida Department of Environmental Protection.

It was recommended by the Kissimmee River Resource Planning Management (380), and the Lake Okeechobee Technical Advisory Committee to; identify trouble spots, inform individual landowners of the impacts of implementing BMPs to improve water quality, and to provide the state and federal agencies responsible for administering cost-share programs, a method of measuring the cost-effectiveness. The District intensified the monitoring effort in fiscal year 87/88, by approximately doubling the number of sampling sites. In fiscal year 91/92, the network design was again modified to provide more intensive and comprehensive monitoring.

The objectives of this program are:

1. Monitoring water quality in support of the FDEP's Dairy Rule, by providing chemistry data for the dairy outflows, and evaluating the effectiveness of dairy BMP's and the Dairy Buy-out program.

2. Assessing tributary, basin loading, and concentration inputs to Lake Okeechobee, including:

   a) Providing levels of total phosphorus at the inflows to Lake Okeechobee to compare with the 0.18 mg/l total phosphorus SWIM standard for the basin loading calculations.

   b) Providing data that will delineate the relative importance of tributary loading within the basin, to the whole basin output.

3. Developing basin and spatial scale models to predict changes in loads to Lake Okeechobee as a function of land use. This includes:

   a) Providing data for determining statistical or mechanistic relationships between rainfall, land use (or land type), and nutrient runoff into streams.

   b) Providing data to help identify the reason for high episodic phosphorus events.

This program fulfills the District's obligations to the Taylor Creek Headwaters and the Rural Clean Waters programs, also the legal obligations under the Lake Okeechobee Operating Permit. In addition, this program is integral in the development of the Lake Okeechobee Water Quality Management Plan as required by the state's SWIM legislation of 1987.

Sampling Location and Description

The locations of the 41 sites monitored under the Taylor Creek/ Nubbin Slough program are shown on Figure 7. Table 14 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 15 contain statistics for each monitoring location.

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	G/A
TCNS 201	272337	805340	On HWY 68. The samples are collected from the bridge over N.W. Taylor Creek at the U.S.G.S. stage station.	1979 - P	BW	BW	G
TCNS 204	272309	805151	On N.W. 144th Drive (Potter Road). The samples are collected from the bridge over Little Bimini.	1979 - P	BW	BW	G
TCNS 206	272415	804835	East of State Road 441 approximately 0.5 miles behind a FP&L substation at Remilu Ranch, and collects runoff from McArthur Dairy Barns #1 and #2. Sample is collected above weir on Otter Creek.	1989 - P	BW	BW	G
TCNS 207	272403	804858	100 yards west of State Road 441 at S-13B bridge over Otter Creek on Wilson Rucks property.	1979 - P	BW	BW	G
TCNS 209	272240	805046	West of State Road 441 on Potter Road. The samples are collected at two large culverts on Potter Road at Outer Creek.	1979 - P	BW	BW	G
TCNS 210	272300	805000	West of State Road 441 on Potter Road. The samples are collected at a tributary that runs across H & T Rucks Barn #3 at Potter Road.	1985 - P	BW	BW	G
TCNS 211	272228	804935	West of State Road 441 on Potter Road. The samples are collected at East Otter Creek and Potter Road at two large roadside culverts.	1979 - P	BW	BW	G
TCNS 212	272302	804904	At East Otter Creek, just off State Road 441 above Remilu Ranch.	1988 - P	M	M	G

TABLE 14 (Continued). Summary of Sampling Station Locations and Frequency of Collection for the Taylor Creek Nubbin Slough Monitoring Program

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	G/A
TCNS 213	272108	805154	West of State Road 441 on State Road 68 at Flying "G" Ranch. The samples are collected approximately 3.5 miles south into Flying "G" Ranch directly below the confluence of Otter Creek, Little Bimini, and NW Taylor Creek.	1979 - P	BW	BW	G
TCNS 214	271804	804920	East of State Road 441 at Williamson Ditch at the Florida School for Boys. The samples are collected directly downstream of the treatment plant at the Boys School.	1979 - P	BW	BW	G
TCNS 217	271644	804926	East of State Road 441, off Cemetary Road. Sample is collected from the weir on Wolf Creek.	1988 - P	BW	BW	G
TCNS 218	271701	804459	Off State Road 70 on N.E. 80th Avenue at a county ditch above Larson Dairy #8.	1988 - P	M	M	G
TCNS 219	271734	804456	North of State Road 70 on N.E. 80th Avenue at Hales Farms runoff above Larson Dairies #5, 6, 7, and 8.	1988 - P	M	M	G
TCNS 220	271512	804613	On State Road 70 at Mosquito Creek. The samples are collected at the Mosquito Creek bridge.	1979 - P	M	M	G
TCNS 222	271413	804053	On State Road 710 and Mosquito Creek. The samples are collected at the Mosquito Creek bridge.	1979 - P	BW	BW	G
TCNS 225	271235	804412	Off State Road 710 and collects runoff from New Palm Dairy at culvert above Newcommer Dairy.	1988 - P	BW	BW	G

TABLE 14 (Continued). Summary of Sampling Station Locations and Frequency of Collection for the Taylor Creek Nubbin Slough Monitoring Program

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	G/A
TCNS 227	271245	804410	At Red Top Dairy off State Road 710. The samples are collected at a surface water ditch approximately 1/2 mile north of ARS 14A that drains several hay pastures into Nubbin Slough.	1987 - P	BW	BW	G
TCNS 228	271213	804445	On State Road 710 and Nubbin Slough. The samples are collected at the Nubbin Slough bridge.	1979 - P	BW	BW	G
TCNS 230	271029	804207	On State Road 710 at Henry Creek. The samples are collected at the Henry Creek bridge.	1979 - P	BW	BW	G
TCNS 231	271028	803910	Off Martin Grade Road and collects runoff from Underhill Dairy.	1988 - P	BW	BW	G
TCNS 233	270956	804114	On State Road 710 at Lettuce Creek. The samples are collected at the Lettuce Creek bridge.	1979 - P	BW	BW	G
TCNS 241	271500	804230	Off Berman Road and collects runoff from Davie Dairy Barn #1 and #2 below the spray field.	1988 - P	BW	BW	G
TCNS 243	272325	805101	Off State Road 68 and is the upstream site of Otter Creek, above H.T. Rucks & Sons Dairy #3.	1988 - P	M	M	G

TABLE 14 (Continued). Summary of Sampling Station Locations and Frequency of Collection for the Taylor Creek Nubbin Slough Monitoring Program

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	G/A
TCNS 249	271520	804142	On Berman Road approximately three miles south of State Road 70. The samples are collected at a culvert where Nubbin Slough crosses Berman Road.	1979 - P	M	M	G
TCNS 252	271237	804337	Off State Road 710 on New Palm Dairy. Sample is taken at tributary culvert above New Palm Dairy.	1988 - P	M	M	G
TCNS 254	271105	803835	Off Martin Grade in Martin County, and is the oncoming tributary north of the Underhill Dairy barn.	1991 - P	M	M	G
TCNS 255	271211	804448	Off State Road 710 and collects runoff from the cooling ponds of Newcomer Dairy going into Nubbin Slough.	1989 - P	BW	BW	G
TCNS 258	271102	804138	Off State Road 710 and collects runoff from Enrico Dairy as it flows into Henry Creek.	1989 - P	BW	BW	G
TCNS 260	272246	805056	The discharge from Rucks & Sons Dairy at Potter Road	1990 - P	BW	BW	G
TCNS 262	271605	804515	North of State Road 70 and collects runoff from Larson Dairy #7 at a culvert just south of Woody's Lane.	1990 - P	BW	BW	G
TCNS 263	271710	804515	North of State Road 70 and collects runoff from Larson Dairy #8 at a culvert just north of Woody's Lane.	1990 - P	BW	BW	G

TABLE 14 (Continued). Summary of Sampling Station Locations and Frequency of Collection for the Taylor Creek Nubbin Slough Monitoring Program

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	G/A
TCNS 265	272410	805155	Off State Road 68 at the culvert on Rucks Dairy Road that collects the outfall H.T. Rucks and Sons Dairy #1.	1991 - P	BW	BW	G
TCNS 268	271530	804248	On Davie Dairy on the southeast property line and collects oncoming water to the Dairy from the Lou Cox property.	1991 - P	M	M	G
TCNS 271	271050	803838	Off Martin Grade Road along the Underhill Dairy access road and collects oncoming water to the dairy.	1991 - P	M	M	G
TCNS 272	271505	804625	The culvert north of Larson Dairy Barn #5 and collects oncoming water to Barn #5.	1992 - P	M	M	G
TCNS 273	271615	804625	At the outfall point at Larson Dairy Barn #5, at Mosquito Creek culvert on Woody's Lane.	1991 - P	BW	BW	G
TCNS 276	272438	805226	Off Calf Barn Road on the McArthur Dairy property and collects runoff from McArthur Dairy Barns #4 & #5.	1991 - P	BW	BW	G
TCNS 277	271655	804557	North of Larson Dairy Barn #8 and collects runoff from the south spray field.	1992 - P	BW	BW	G
TCNS 280	271557	804645	Larson Dairy #5 east spray field outlet at riser.	1994 - P	BW	BW	G

SECTION 7
INDIAN RIVER LAGOON
PROJECT CODE: IRL

Purpose and Scope

The Indian River Lagoon water quality monitoring program is a lagoon wide monitoring program that involves 5 agencies: South Florida Water Management District (SFWMD), St.Johns River Water Management District (SJRWMD), Volusia County, Brevard County, and Indian River County who took over the FDEP's responsibilities. The SFWMD jurisdiction encompasses a 40 mile stretch of the lagoon from Jupiter Inlet to the northern boundary of St. Lucie County. The water quality monitoring program was established to provide a water quality data base for:

1. Documenting known problem areas within the lagoon system, especially those that are located near urban areas and point source discharges;

2. Locating and reviewing existing stations monitored by state, regional and local environmental groups;

3. Locating and establishing monitoring stations in the lagoon and it's tributaries not currently being monitored;

4. Determining parameters that will best evaluate the water quality of the lagoon;

5. Establishing water quality assurance requirements for the field and laboratory; and

6. Documenting long term trends within the lagoon, especially in areas where good biological or water quality conditions currently exist.

This is a SWIM program that began in October, 1988. The collection and analysis of the samples were contracted out during the first two years of the study. In October 1990, the collection and analysis of the samples within the SFWMD boundaries were taken over by the SFWMD.

The data collected can indicate any changes in water quality, and allow for better management of the Indian River Lagoon for environmental enhancement, and prevention of any further degradation.

Sampling Locations and Descriptions

The locations of the 40 sites monitored under this program are shown in Figure 8. Table 16 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 17 contain statistics for each monitoring location.

SECTION 8

ST. LUCIE ESTUARY
PROJECT CODE: SE

Purpose and Scope

The St. Lucie Estuary is a major coastal resource of east central Florida. It supports a variety of commercial and recreational activities, and provides an important habitat for many aquatic organisms. This estuary is located at the east end of the Okeechobee Waterway which crosses south central Florida. It also acts as a navigational channel and outlet for discharges of excess fresh water from Lake Okeechobee and the St. Lucie canal basin.

The St. Lucie Estuary surface water monitoring program is part of a Surface Water Improvement and Management (SWIM) program that began in 1989. The areas of interest are the St. Lucie Inlet and both the north and south forks of the St. Lucie River.

The water quality monitoring program provides a water quality data base for:

1. Documenting problem areas within the St. Lucie Estuary system, and especially those that may be related to point source discharges;

2. Locating and reviewing any existing stations and data that might exist and comparing the data;

3. Locating and establishing monitoring stations in the estuary not currently being monitored;

4. Determining parameters that will best evaluate the water quality of the estuary; and

5. Documenting long term trends within the estuary, especially in areas where good biological or water quality data currently exists.

The SE project began in October 1989. The collection and analysis of the samples were contracted to a private firm during the first year of the study. In October 1990 the collection and analysis of the samples was taken over by the SFWMD.

The data can indicate changes in water quality and allow for better management of the estuary for environmental enhancement and prevention of any further degradation.

Sampling Locations and Descriptions

The locations of the 10 sites monitored under this program are shown on Figure 9. Table 18 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 19 contain statistics for each monitoring location.

SECTION 9

UPPER AND LOWER EAST COAST
PROJECT CODE: WQM

Purpose and Scope

The Upper and Lower East Coast water quality monitoring program was initiated in 1979 and includes the coastal portions of St. Lucie, Martin, and Palm Beach Counties. The water quality monitoring program provides a water quality and nutrient loading data base for:

1. Determining loadings to the Indian River Lagoon, St.Lucie Estuary, Loxahatchee River, and Lake Worth Lagoon;

2. Determining long and short term trends;

3. Identifying seasonal and discharge related water quality trends;

4. Calculating material loads, basin-wide areal export rates, and flow-weighted concentrations; and

5. Implementing LOTAC's recommendation for a comprehensive monitoring and research plan as described in the Department of Environmental Protection "Lake Okeechobee Monitoring and Research Plan."

Sampling Locations and Descriptions

The locations of the 10 sites monitored under this program are shown on Figure 10. Table 20 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 21 contain statistics for each monitoring location.

SECTION 10

WORKS OF THE DISTRICT PERMIT COMPLIANCE
PROJECT CODE: WOD

Purpose and Scope

The Works of the District Permit Compliance water quality monitoring program encompasses the Lake Okeechobee Drainage Basin. The water quality monitoring program was established by the Works of the District (WOD) Rule, Chapter 40E-61, F.A.C., for the purpose of:

1. Documenting permittee compliance with off site discharge total phosphorus concentration limitations established by the Lake Okeechobee SWIM Plan.

2. Each permitted parcel is evaluated for compliance with Rule 40E-61 Phosphorus concentration limitations.

Sampling Location and Descriptions

There are approximately 175 water quality monitoring stations which are sampled under the WOD Compliance program, however, this number will change continuously as the number of active permits change. The stations are located in Okeechobee, Highlands, Martin, and Glades counties.

Sample site locations are determined by the District's Regulation Department upon permit issuance.

A private laboratory is contracted to perform all analytical work.

Parameters and Sampling Frequencies

Water samples are collected biweekly at all active monitoring locations. Total phosphorus is the only parameter analyzed. Monitoring is performed for a minimum of 12 months. If the site is within compliance of the permit conditions after 12 months, the monitoring is discontinued. If the site exceeds permit conditions, monitoring is continued indefinitely.

SECTION 11

LAKE OKEECHOBEE MONITORING PROGRAMS
PROJECT CODE: X = INFLOWS/OUTFLOWS
PROJECT CODES: Y, YS, YGS, YN, YSRG, YNRG, and OLIT = LIMNETIC AND LITTORAL ZONES

Purpose and Scope

The Lake Okeechobee Inflows and Outflows water quality monitoring program encompasses the entire perimeter of Lake Okeechobee. The Lake Okeechobee Limnetic and Littoral Zones water quality monitoring program lies wholly within the confines of the Lake Okeechobee levee. The water quality monitoring programs were established to provide a water quality and nutrient loading data base for:

1. Complying with monitoring requirements of the Lake Okeechobee Operating Permit #50-0679349 issued by the Florida Department of Environmental Protection (FDEP);

2. Determining effectiveness of the implementation of basin management plans in reducing nutrient loadings into the lake as specified in the Surface Water Improvement and Management Act of 1987;

3. Implementing the Lake Okeechobee Technical Advisory Committee's recommendation for a comprehensive monitoring and research plan as described in FDEP's "Lake Okeechobee Monitoring and Research Plan";

4. Determining long and short term trends necessary to identify potential problem areas in terms of water quality degradation, nutrient loadings, and tracking eutrophication of the lake; and

5. Applying eutrophication models in order to verify and refine the nutrient load targets for the lake and rank its trophic status.

Water quality data from Lake Okeechobee are also used to support Lake Okeechobee management reports as required by the Surface Water Improvement Management (SWIM) Act. Evaluation of the data is then used for:

1. Assessing the impact of operating permit management implementations;

2. Verifying water quality models;

3. Examining differences in water quality between the limnetic and littoral zones;

4. Monitoring possible algal blooms in the limnetic and littoral zones; and

5. Providing water quality data in support of nutrient dynamics studies.

6. Monitor for changes in water quality following basin management strategies

Water quality data are also used to establish nutrient budgets for Lake Okeechobee. Nutrient loadings are calculated from nutrient concentrations and flow data from the various inflow/outflow stations.

Historical data collected between 1973 and 1979 provide baseline water quality data prior to implementation of water quality management plans. Comparison with recent sampling data can indicate changes in water quality and allow for better management of the system for environmental enhancement or prevention of degradation. Values that deviate significantly from established criteria may signal a situation requiring immediate attention.

Sampling Locations and Descriptions

The location of the 35 sites monitored under project "X", 17 for project "YSRG" and "YNRG", 11 for project "OLIT", 14 for project "YN", and the 15 for project "YS" are shown in Figures 11 and 12. Tables 22 and 23 list all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 24 contain statistics for each monitoring location.

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	Major Ions	Trace Metals	US/DS	G/A
S2	264200	804259	A South Florida Water Management District (SFWMD or District) controlled water pumping station located on the south side of Lake Okeechobee near Belle Glade. It is at the confluence of the Hillsboro and North New River Canals, and pumps into Lake Okeechobee. When water is let out of the lake it discharges through S351 which is next to S2. When this occurs the sample is collected from the canal side of S351,however, the station code is written as S2 with a discharge code of 3.	1973 - P	BWF/M	W/BWF/M	QTR	QTR	US/DS	G/A
S3	264155	804827	A District controlled water pumping station located on the south side of Lake Okeechobee at Lake Harbor. Water is pumped from the Miami Canal into Lake Okeechobee. When water is let out of the lake it discharges through S354 which is next to S3. When this occurs the sample is collected from the canal side of S354, however, the station code is written as S3 with a discharge code of 3.	1973 - P	BWF/M	W/BWF/M	QTR	QTR	US/DS	G/A
S4	264722	805743	A District controlled water pumping station on C-20 near Clewiston that pumps water into Lake Okeechobee.	1976 - P	BWF/M	W/BWF/M	QTR	QTR	US	G
INDUSCAN	264514	805508	Water samples from this station are collected from the bridge over the Industrial Canal in Clewiston on County Road 832.	1982 - P	BWF/M	BWF/M	QTR	QTR	-	G
S77	265023	810518	A large spillway type structure and locks operated by the COE. It is located at the head of the Caloosahatchee River where water from Lake Okeechobee is discharged down the river.	1973 - P	BWF/M	BWF/M	QTR	QTR	US	G
FECSR78	265744	810715	Water samples from this station are collected from the bridge on State Road 78 where it crosses Fisheating Creek. Water can flow towards Lake Okeechobee or water can flow west in this canal at this point depending on water stages.	1973 - P	BWF/M	BWF/M	QTR	QTR	-	G

TABLE 22 (Continued). Summary of Sampling Station Locations and Frequency of Collection for the Lake Okeechobee Inflow/Outflow Monitoring Program

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	Major Ions	Trace Metals	US/DS	G/A
S71	270201	811811	A spillway type structure and pump station located near the west side of Lake Okeechobee on Harney Pond Canal (C-41) about 1.5 miles northwest of State Road 78.	1973 - P	BW	BW	QTR	QTR	US	G
S72	270532	810023	A gate type structure located near the northwest side of Lake Okeechobee, in C-40 about two miles northwest of State Road 78.	1973 - P	BWF/M	BWF/M	QTR	QTR	US	G
S65E	271335	805742	A large gate and boat lock structure on the Kissimmee River, 8 1/2 miles northwest of Lake Okeechobee. This is the southernmost structure on the Kissimmee River, and it discharges water into Lake Okeechobee.	1973 - P	QTR	QTR	QTR	QTR	US	G
S84	271250	805830	A gate type structure where C-41A intersects the Kissimmee River. Water flows into the Kissimmee River through this structure.	1973 - P	BW	BW	QTR	QTR	US	G
S191	271135	804535	A large gate type structure on the north side of Lake Okeechobee at Nubbin Slough. Water flows into the lake through this structure. Water samples are collected from the north side of this structure.	1973 - P	BW	BW	QTR	QTR	US	G
S308C	265904	803717	A COE gated structure and boat lock on the St. Lucie Canal (C-44) at Lake Okeechobee. Water can flow in or out of the lake through this structure. Water samples are collected from the lake side of this structure.	73-74/81-P	BWF/M	BWF/M	QTR	QTR	US	G

SFWMD Sta. ID	Lat	Long	Location	POR	Physical Parameters	Nutrients	Major Ions	Trace Metals	US/DS	G/A
S352	265145	803755	S352(formerly HGS5) is a spillway gate structure operated by the United States Army Corps of Engineers (COE). S352 is on the east side of Lake Okeechobee near Canal Point. Water is released out of Lake Okeechobee through this structure, however, water can flow into the lake when lake levels are low. In 1989 the HGS5 structure was replaced and renamed S352.	1973 - P	BWF/M	BWF/M	QTR	QTR	DS	G/A
CULV4A	264056	804502	A small private pumping station on US-27, 2 1/2 miles west of Belle Glade that pumps water from the South Shore Drainage District into Lake Okeechobee via Culvert 4A. Water samples are collected from the upstream side of the pump. Water can gravity flow out of the Lake through this pump.	1979 - P	BWF/M	BWF/M	QTR	QTR	US	G
CULV10	264753	804146	There are four private pump stations associated with CULV10, CULV10A, CULV12, and CULV12A. These sites are located on the southeast side of Lake Okeechobee. The pumps belong to East Beach Water Control District, Closter Farms, East Shore Drainage District, and East Shore Water Control District. Water is pumped into Lake Okeechobee through these four structures. Water can also gravity flow out of the Lake through these pumps. Water samples are collected from the upstream side of each pump station.	1979 - P	BWF/M	BWF/M	QTR	QTR	US	G

SECTION 12

CALOOSAHATCHEE RIVER
PROJECT CODE: CR

Purpose and Scope

The Caloosahatchee River water quality monitoring program was established in 1979, and extends from Lake Okeechobee west to the coastal structure that releases fresh water to the Caloosahatchee Estuary. The water quality monitoring program provides a water quality and nutrient loading data base for:

1. Determining loadings to the Caloosahatchee River estuary;

2. Assessing potential downstream impacts on the Caloosahatchee River estuary.;

3. Implementing LOTAC's recommendation for a comprehensive monitoring and research plan as described in the Department of Environmental Protection "Lake Okeechobee Monitoring and Research Plan"; and

4. Determining long and short term trends necessary to identify potential problem areas in terms of water quality degradation and nutrient loadings.

Water quality data from the Caloosahatchee River are also used to determine the effect of Lake Okeechobee discharges and tributary impacts on the Caloosahatchee River.

Sampling Locations and Descriptions

The locations of the four sites monitored under this program are shown on Figure 13. Table 26 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 27 contain statistics for each monitoring location.

SECTION 13

EVERGLADES NUTRIENT REMOVAL
PROJECT CODES: ENRR, ENRU, ENRP, ENRG

Purpose and Scope

The Everglades Nutrient Removal (ENR) Project is a "constructed", or man-made wetland designed to biologically remove phosphorus from agricultural runoff water before it enters the Arthur R. Marshall Loxahatchee National Wildlife Refuge, also known as Water Conservation Area 1.The total project size is 3,975 acres, with 3,680 acres of constructed wetlands.

The ENR Project is a crucial component of the Districts comprehensive Everglades restoration effort. The ENR project provides valuable information for the operation and management of the larger constructed wetlands, called Stormwater Treatment Areas (STAs). The 1993 Everglades Forever Act mandates that the District develop STA's as a method to restore the Everglades.

The objectives of the ENR Project are to reduce the phosphorus loads to Water Conservation Area 1, optimize STA operation for phosphorus removal, provide reasonable assurance to the Florida Department of Environmental Protection(FDEP) that the proposed conceptual design for STAs will meet the requirements of applicable Florida statutes, regulations, and standards, and provide cost avoidance.

The analysis of the water samples is split between the District, USGS, and private labs as follows:

USGS: Analyzes Total Kjeldahl Nitrogen, Total Phosphorus, Nitrate + Nitrite, and Ammonia for the internal marsh sites collected by an automatic sampler. And they analyze bi-weekly and monthly grab samples for all sites, except permit sites for; physical parameters, nutrients, ions, and metals.

Private: They analyze bi-weekly low level Total Suspended Solids on grab samples collected at all sites except permit sites, and Total and Methyl Mercury are analyzed for at some interior and levy sites, and at the permit sites bi-weekly and monthly.

FDEP: Analyzes quarterly grab samples at the permit sites for pesticides and priority pollutants.

SFWMD: Analyzes all remaining parameters listed in the permit, and those being collected for various research projects.

Sampling Locations and Descriptions

The locations of the 23 sites monitored under this program are shown in Figure 14. Table 28 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Table 29 contains statistics by parameter.

SECTION 14

HOLEY LAND
PROJECT CODE: HOLY

Purpose and Scope

In 1983 a Memorandum of Agreement between the Florida Department of Environmental Regulation (FDEP), the Board of Trustees of the Internal Improvement Trust Fund (BTIITF), the South Florida Water Management District, and the Florida Game and Fresh Water Fish Commission (G&FWFC) was established to design and construct a restoration plan for the Holey Land and Rotenberger Tracts as well as a portion of the Seminole Indian Reservation.

In 1990 a Memorandum of Agreement between the SFWMD and G&FWFC was established to begin the monitoring of the Holey Land. The water quality monitoring program involves collecting data, and documenting conditions to better understand the hydrology and environmental resources in achieving the goals of the Holey Land Restoration Project.

Project HOLY was established specifically to meet the requirements of FDEP Permit #06 500809209.

Sampling Locations and Descriptions

The Holey Land monitoring program includes project "HOLY" which monitors seven surface water inflow and outflow structures and four interior sediment sites. The location of these stations are shown in Figure 15. Table 30 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 31 contain statistics for each monitoring location.

Parameter and Sampling Frequencies

Prior to July 1992 project HOLY was sampled weekly for total phosphorus only. The FDEP permit requires the District to monitor surface water on a quarterly basis, and sediment semi-annually.

SECTION 15

EVERGLADES PROTECTION AREA
PROJECT CODE: EVPA

Purpose and Scope

The Everglades Protection Area Project (EVPA) consists of all three Water Conservation Areas (WCA1,2,&3), and is designed to monitor the physical, chemical and biological quality of the Everglades Protection Area. The water, sediment, and tissue quality data obtained under this program will be used to:

1. Evaluate water quality status and trends;

2. Assess compliance with federal and state water quality statutes, the Everglades Forever Act; and the Everglades Settlement Agreement;

3. Aid in the translation of narratives to numerical water quality criteria and in the development of site-specific alternative criteria;

4. Guide mid and long term resource management decision making to restore the ecological structure and function of the Everglades; and

5. Minimize the duplication effort between monitoring programs, ensure uniformity of monitoring methods and data interpretation, and provide a comprehensive framework for data interpretation.

The sampling of inflows, outflows, biological, sediments, organics, and rain within the EVPA are addressed in other sections of this publication.

Sample analyses for all parameters except Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) are performed by USGS laboratory in Ocala under a contractual agreement. TOC and DOC are analyzed by SFWMD laboratory. Pesticides are analyzed by FDEP laboratory.

Sampling Locations and Descriptions

The locations of the 30 sites monitored under this program are shown in Figures 16, 17, and 18. Table 32 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the samples are collected up stream or down stream, and type of sample collection. Table 33 contains statistics by parameter.

SECTION 16

Big Cypress Seminole Indians
PROJECT CODE: SEMI

Purpose and Scope

The Big Cypress Seminole Indian Reservation is west of Water Conservation Area 3A. The monitoring is being done in response to an agreement between the District and the Seminole Indian Tribe of Florida. The monitoring covers the inflow points to the Big Cypress Seminole Indian reservation.

The objectives of this program are:

1. To determine the quality of water delivered to the Big Cypress Indian Reservation through the L-28 Borrow canal before and after the diversion of all or a portion of the C-139 Basin;

2. To determine the quality of water delivered to the Big Cypress Indian Reservation through the North and West Feeder Canals.

Sampling Locations and Descriptions

The locations of the 2 sites monitored under the SEMI project are shown in Figure 19. Table 34. lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the samples are collected upstream or downstream, and type of sample collection.

SECTION 17

WATER CONSERVATION AREA INFLOWS AND OUTFLOWS AND TAMIAMI BRIDGE CULVERTS

PROJECT CODES: CAMB, TAMB

Purpose and Scope

The Water Conservation Area (WCA) Inflows and Outflows, and the Tamiami Bridge Culverts water quality monitoring programs encompasses an area of over 1,300 square miles of Everglades marsh that receive waters from a variety of land uses, such as; agricultural, native and improved pastures, and urban and rural communities. The water quality monitoring program provides a water quality and nutrient loading data base for:

1. Complying with monitoring requirements of the Everglades National Park (TENP) Memorandum of Agreement (MOA) between the National Park Service, the South Florida Water Management District (SFWMD or District), and the United States Army Corps of Engineers (COE);

2. Implementing the Lake Okeechobee Technical Advisory Committee's (LOTAC)'s recommendation for a comprehensive monitoring and research plan as described in the Department of Environmental Protection's "Lake Okeechobee Monitoring and Research Plan";

3. Determining long and short term trends necessary to identify the downstream impacts of LOTAC's Surface Water Improvement and Management (SWIM) implementation plan for the Everglades Agricultural Area (EAA); and

4. Determining effectiveness of the implementation of basin management plans in reducing nutrient loadings to the WCA.

Water quality data are also used to establish nutrient budgets for the WCA. Monitoring of nutrients and other water quality parameters is important in the quantification of the effect of inflows on the ecology of the marsh. With the implementation of the SWIM Act, the data collected will be instrumental in evaluating downstream impacts of the Interim Action Plan and other possible management alternatives for the EAA.

These data can indicate trends in the changes in water quality, allow for better management of the system, and monitor for environmental enhancement or degradation. Values that deviate significantly from established criteria may signal a concern requiring immediate attention.

Sampling Locations and Descriptions

The locations of the (45) sites monitored under the CAMB program and the 20 sites monitored under project TAMB are shown in Figures 20 and 21. Table 35 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection for each program respectively. Table 36 contain statistics for each monitoring location for each program. In October 1996, upon approval of the Technical Oversite Committee(TOC), the TAMB sites were seperated out from the CAMB program, and reduced from 19 sites to 11. The parameter list and frequencies have been modified under the TAMB program. See table 35 for the modifications made to this program.

SECTION 18

THE BISCAYNE BAY WATER QUALITY MONITORING PROGRAM
PROJECT CODE: BISC

Purpose and Scope

This cooperative program with Dade County Department of Environmental Resources Management (DERM) consists of monthly surface water quality monitoring in Biscayne Bay and its major tributaries. DERM began routine monitoring of Biscayne Bay surface water quality in March 1979. The original program consisted of 48 fixed stations distributed throughout the Bay and at the mouths of most major tributaries. Over the years, sampling stations were added and the parameter matrix was modified. The most significant changes occurred when the District began funding the Program in 1988 as part of the Biscayne Bay Surface Water Management and Implementation (SWIM) Plan. Degradation of water quality in Biscayne Bay was a primary factor that influenced the State legislature to place Biscayne Bay on the initial SWIM priority list. Stations were added primarily in the tributaries and the parameter matrix was expanded in an effort to 1) detect spatial, seasonal and interannual trends and possible impacts on the health of the bay ecosystem; and 2) identify areas of potential degradation. These data have been instrumental in documenting a variety of impacts to surface water quality in Biscayne Bay and continue to give direction for investigations and remedial actions. The data are regularly used by academic institutions, private sector organizations and public agencies.
Monthly surface water quality monitoring at 25 sites in Biscayne Bay is also conducted by Florida International University as part of the South Florida Estuarine Water Quality Monitoring Program described in Section 23.

Sampling Locations and Descriptions

The routine water quality monitoring network consists of 90 stations at which monthly samples are collected and analyzed for a variety of physical, chemical and biological parameters to characterize the water quality. Figures 22 and 23 depict the sampling locations. Table 37 lists the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and the type of sample collection. Table 38 contains basic summary statistics for select parameters at each monitoring location.

SECTION 19

EVERGLADES NATIONAL PARK
PROJECT CODES: ENP and EVER

Purpose and Scope

The Everglades National Park (PARK) water quality monitoring programs were established to address the quality of water entering and leaving the PARK as well as the interior of the PARK. In January 1979, the South Florida Water Management District (SFWMD or District), the National Park Service and the United States Army Corps of Engineers (COE) entered into a joint Memorandum of Agreement (MOA) with the intent to establish non-degradation standards for water quality parameters for waters delivered to the PARK through water control structures along L-67A, L-31W and C-111. In October 1985, the District agreed to take over the responsibility for analyzing the samples collected from the interior of the PARK. The collection of the water samples from the interior of the PARK are collected by the PARK personnel. All appropriate sampling supplies are provided by the District.

These water quality monitoring programs provide a water quality and nutrient loading data base for:

1. Determining long and short term trends necessary to identify the downstream impacts of the Lake Okeechobee Technical Advisory Committee (LOTAC) / Surface Water Improvement and Management (SWIM) plan implementation for the Everglades Agricultural Area.

2. Implementing LOTAC's recommendation for a comprehensive monitoring and research plan as described in the Department of Environmental Regulation's "Lake Okeechobee Monitoring and Research Plan."

3. Comparing standards that were established for inflow water quality to the PARK. These standards are based on historical (1970-1978) average annual concentrations. At least annually, the District, PARK, and the COE meet to discuss any violations of the standards. As stated in the MOA, "Should water quality criteria not be met and a clear and present danger to water quality been determined by the parties, appropriate actions or such legal processes as may be necessary to restore or protect the quality of water entering the PARK shall be taken by the COE, National Park Service, and the District." The data analyzed by the District are forwarded to the PARK and the COE on a monthly basis.

Sampling Locations and Descriptions

The locations of the 17 sites monitored under these programs are shown on Figures 24 and 25. Project ENP consists of eight inflow/outflow sites, and project EVER consists of nine interior sites. There are 10 additional watershed monitoring sites associated with this program, these are; S-12D, S-12B, S-333, L3BRN, L-28I, S-140, S-11C, S-7, S-8, and S-9 which are shown on Figure 20, and are described in Section 17. Table 39 and 40 list all the station ID's, latitudes and longitudes, brief station descriptions, the period of record, the frequency of collection for each parameter group, whether the sample is collected upstream or downstream, and type of sample collection. Tables 41 through 42 contain statistics for each monitoring location.

SECTION 20

ROUTINE PESTICIDE MONITORING NETWORK
PROJECT CODE: PEST

Purpose and Scope

The Routine Pesticide monitoring network encompasses most of the area covered by the SFWMD. The pesticide monitoring program was established to provide a water quality data base for:

1. Complying with monitoring requirements of the Lake Okeechobee Operating Permit #50-0679349 issued by the Florida Department of Environmental Regulation (FDEP);

2. Complying with the Memorandum of Agreement (MOA) between the Miccosukee Tribe of Florida and the South Florida Water Management District (District);

3. Complying with the MOA between TENP, District, and Army Corps of Engineers (COE);

4. Implementing Lake Okeechobee Technical Advisory Committee (LOTAC)'s recommendation for a comprehensive monitoring and research plan as described in FDEP's "Lake Okeechobee Monitoring and Research Plan"; and

5. Determining long and short term trends necessary to identify potential problem areas in terms of pollution by organic contaminants (herbicides and pesticides).

Data have been collected since 1980. Initially only a few stations were collected for a narrow range of pesticides. The routine network was significantly expanded in 1984 and again in 1988, to form the framework of the current monitoring program. These data can indicate trends in the changes in water quality and allow for better management of the system. The presence of any detectable amount of pesticide may be of environmental concern, and is being documented to establish baseline levels, and to initiate follow up action by the appropriate state or federal agency.

The analyses are done contractually with FDEP laboratory in Tallahassee.

Sampling Locations and Descriptions

The locations of the 27 sites monitored under this program are shown in Figure 26. Table 43 lists all the station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection of pesticides, whether the sample is collected upstream or downstream, and type of sample collection.

Pesticide Sampling Frequency

Prior to 1991 water and sediment samples were collected quarterly. In 1991 the frequency was changed to that shown on Table 58.

SECTION 21

ATMOSPHERIC DEPOSITION MONITORING PROGRAM
PROJECT CODE: RAIN

Purpose and Scope

The Wet/Dry Atmospheric Deposition monitoring program encompasses an area from the northern end of the Kissimmee River, south to the Everglades National Park. From 1974 to 1987 bulk rain collectors were used to collect rain water samples. In 1987 the District switched to Areochem Wet/Dry precipitation collectors, and in March of 1992, based on recommendations from the USGS, the District changed its protocol for the Wet/Dry precipitation collectors to that used by the National Atmospheric Deposition Program (NADP).

The rain program was established to provide a water quality data base for:

1. Determining nutrient concentrations in wet and dry atmospheric deposition;

2. Determining nutrient loading rates;

3. Refine trend analysis; and

4. Determining spatial variability.

5. Permit compliance for the ENR project.

Sampling Locations and Descriptions

The locations of the 19 wet/dry atmospheric monitoring locations are shown on Figure 27. Table 44 lists all the station ID's, latitude and longitude, a brief station description, the period of record, and the frequency of collection for each parameter group.

SECTION 22

MANATEE BAY / LONG SOUND
PROJECT CODE: MBLS

Purpose and Scope

The MBLS water quality monitoring program is conducted in the C-111 canal, Manatee Bay, Barnes Sound, and Long Sound areas. This monitoring program is conducted in conjunction with the C-111 monitoring and operation permit # 131654749. Water quality monitoring occurs when at least 3 of the 13 culverts are opened at S-197. Various biological and hydrological monitoring will occur at the same time. Other environmental monitoring is conducted in these same areas by TENP and DERM. The MBLS water quality monitoring program provides a data base for:

1. Determining Manatee Bay/ Barnes Sound salinity responses to storm related discharges at S-197;

2. Establishing salinity gradients in Northeast Florida Bay associated with normal flow diversions through the C-111 gaps;

3. Monitoring any additional influx of nutrients in the TENP eastern panhandle resulting from through the gaps;

4. Monitoring salinity and water quality impacts downstream of S-21 (C-1W diversions); and

5. Establishing spatial impacts on salinity gradients, and how quickly they are re-established following a discharge event.

Sampling Locations and Descriptions

The location of the 22 sites monitored under this program are shown on Figure 28. Currently nutrients and physical parameters are sampled for at 8 of the 22 sites, and only physical parameters are sampled at the remaining 14 sites. Table 45 lists all station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 46 contain statistics for each monitoring location.

SECTION 23

THE SOUTH FLORIDA ESTUARINE WATER QUALITY MONITORING PROGRAM

PROJECT CODE: FLAB, SWS, TTI, BISC

Purpose and Scope

This collaborative program with the Everglades National Park (ENP) and Florida International University (FIU) consists of surface water quality monitoring networks in the Shark Slough estuaries, Florida, Whitewater and Biscayne Bay, the Ten Thousand Islands, and the southwest Florida Shelf. This program has two components: 1) continuous data collection from fixed stations by ENP; and 2) discontinuous "grab sample" data collection by FIU.

The ENP continuous data collection project includes three elements: 1) the marine monitoring network (MMN); 2) the C-111 and Joe Bay network; and 3) the telemetric data network. The MMN, maintains and collects continuous physical-chemical data from 28 fixed stations within the Park. As ENP expands the MMN network on the Gulf Coast will be reported. The second element consists of continuous data collection from the Joe Bay meteorological tower and four C-111 stations in Manatee Bay and Barnes Sound, which are jointly operated and maintained by the ENP and the District. The third element consists of data that are telemetered daily from 15 MMN sites and the Joe Bay tower.

The discontinuous data collection or "grab sample" project operated by FIU consists of 149 stations, of which 100 are sampled monthly and the 49 that are located along five transects in the Gulf of Mexico are sampled quarterly. These 49 sites change slightly each trip, but are sampled along the same transect each time. Because of the slight change in location each trip, the station name changes each time. All of the sites are monitored for a variety of physical, chemical, and biological parameters to characterize water quality.

The objectives of these monitoring networks are to 1) better understand the potential for southwest Florida Shelf waters to impact Florida Bay and the Florida Keys National Marine Sanctuary, 2) assess the impacts of upstream water management practices on the receiving waterbodies, 3) detect trends in the health of the resource, and 4) fulfill requirements of legal mandates.

The data collected under this cooperative program are compiled in databases and used effectively in preparing District reports. They are submitted to FDEP to fulfill permit requirements and are used to evaluate impacts of proposed structural and operational modifications to the system. These data are also used to address questions concerning freshwater inflow, water clarity, salinity, and nutrient availability patterns, and will remain an integral component of the effort to restore the south Florida ecosystem.

Sampling Locations and Descriptions

This monitoring program consists of 182 sites, and covers the estuarine waters from Biscayne Bay south through Florida and Whitewater bays, and up the southwest Florida coast to the Ten Thousand Islands. The sampling locations are shown in Figures 29 and 30. Table 47 lists all station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 48 contains basic summary statistics for select parameters at each monitoring location.

District Publications: None

BIG CYPRESS PRESERVE WATER QUALITY MONITORING PROGRAM
PROJECT CODE: BCWQ

Purpose and Scope

The Big Cypress National Preserve(BCNP) is located in Southwest Florida within the Big Cypress Swamp. The 729,000-acre Preserve consists of predominantly wetlands habitat. The surface waters within the Preserve are designated as Outstanding Florida Waters(Florida Administrative Code (F.A.C.) 62-302.700). No degradation of water quality, other than allowed in Rule 62-4.242(2) and F.A.C. is permited.

A hydrologic monitoring program was established by the BCNP in 1987 to ensure the protection and preservation of preserve waters.

Interpretive data reports are submitted to the District annually and progress reports are submitted semiannually. The data provide information to identify freshwater flows that are critical to the survival of the Big Cypress watershed and Everglades National Park.

Sampling Locations and Descriptions

Under a continuing cooperative agreement with the District, the Preserve maintains a hydrologic monitoring network of 14 sites at which both water stage and quality are measured. The locations of these 14 sites are shown on Figure 31. Water stage is recorded continuously by the Preserve at 12 of the 14 sites, and the USGS maintains the other two. Water quality samples are collected by the Preserve and analyzed by the Districts Laboratory. Table 50 lists all station ID's, latitude and longitude, a brief station description, the period of record, the frequency of collection for each parameter group, and type of sample collection. Table 51 contains basic statistics for select parameters at each monitoring location.

District Publications

None
